

The same class of system-spanning avalanche occurs in both trajectories

Current T trajectory

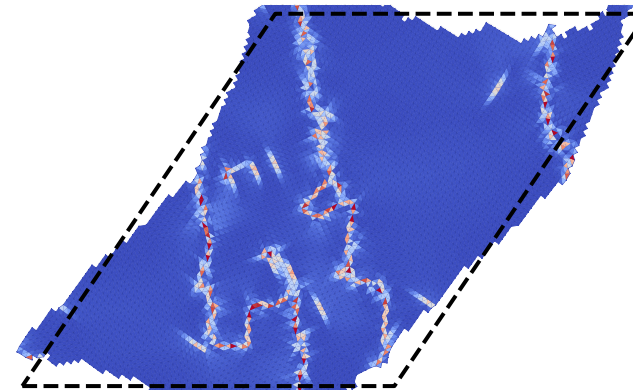

Immediately before $\gamma = 0.66$
 $\langle E \rangle = 0.0303$, $\langle \sigma_{12} \rangle = 0.400$, $N_{\text{changed}} = 91$

Avalanche step $\gamma = 0.67$
 $\langle E \rangle = 0.0068$, $\langle \sigma_{12} \rangle = 0.032$, $N_{\text{changed}} = 1075$

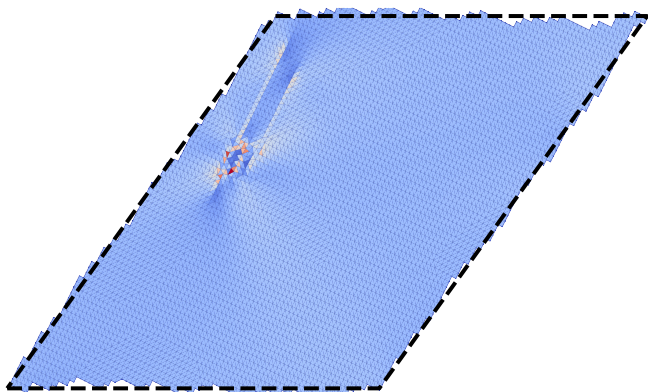

Immediately after $\gamma = 0.68$
 $\langle E \rangle = 0.0066$, $\langle \sigma_{12} \rangle = 0.043$, $N_{\text{changed}} = 182$

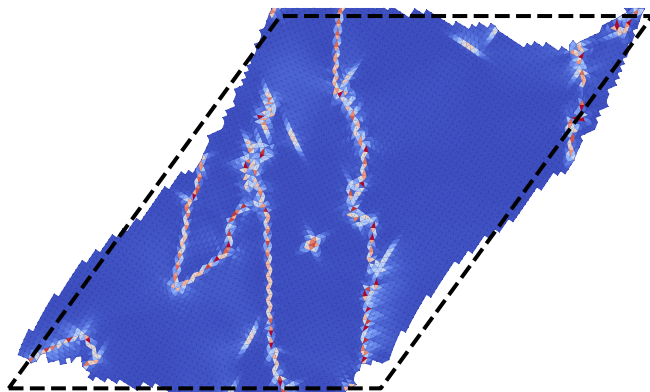

Direct T trajectory

Immediately before $\gamma = 0.72$
 $\langle E \rangle = 0.0358$, $\langle \sigma_{12} \rangle = 0.438$, $N_{\text{changed}} = 28$

Avalanche step $\gamma = 0.73$
 $\langle E \rangle = 0.0068$, $\langle \sigma_{12} \rangle = 0.027$, $N_{\text{changed}} = 1094$

Immediately after $\gamma = 0.74$
 $\langle E \rangle = 0.0065$, $\langle \sigma_{12} \rangle = 0.025$, $N_{\text{changed}} = 219$
